

Supplemental Figure 2. ***Subjects vaccinated in the prior season have higher initial HA-specific antibody titers.*** Subjects that received influenza vaccine in the previous season are indicated here as “V” (closed symbols) and subjects who reported that they had not received influenza vaccine in the previous season are indicated here as “UV” (open symbols). The neutralizing antibody response measured by HAI assay is shown for each protein, H1 upper left, H3 upper right, B/Phuket lower left and B/Brisbane lower right. Shown is the titer day 0, prior to vaccination. The geometric mean is indicated by a red line and the p value calculated using the Mann-Whitney U test is indicated in the upper left corner for each HA protein.
